

APPLICATION GATEWAY SYSTEM

ABSTRACT OF THE DISCLOSURE

A system for permitting a subscriber to access subscriber information from a remote enterprise network in real-time is presented. The system includes a remote access device with browser capabilities for inputting requests to access the subscriber information. The remote access device communicates with an application gateway server, and the application gateway server rapidly and efficiently processes the requests to access the subscriber information and renders the requested subscriber information on the remote access device. The application gateway server includes a navigation module, a rendering module, a session module, a data access module, and an authentication module for efficiently retrieving user/subscriber data, such as mail, contact, or other user specific data and compiling and sending browser specific data to the input device.
